                                 The invention provides a monoclonal antibody (MAb) designated 1A7, which elicits an anti-GD2 (tumor-associated antigen) immunological response in humans. MAb 1A7 has defined light and heavy chain variable region sequences. The MAb 1A7 and polypeptides can be used for eliciting an anti-GD2 immune response. The polypeptides can also be used for detecting or purifying anti-GD2 antibody. The products can be used for treating GD2 -associated diseases, e.g. melanoma, neuroblastoma, glioma, soft tissue carcinoma, and small cell carcinoma. They can be used for palliating the disease or for reducing the risk of recurrence. Sequences AAC31373-90 represent sequences that closely matched MAb 1A7 heavy chain variable region encoding sequence.

                                                                                                                                             (AAW06204) of the LEW rat anti-porcine xenograft monoclonal antibody 1H21H7. It was obtd. from a IH21H7 heavy chain cDNA library by phage display and PCR amplification, and can be used to produce recombinant IH21H7 antibody fragments, e.g. F(ab')2 and Fab'. These block binding of preformed anti-donor xenograft antibodies in a recipient animal serum to antigen expressed by endothelial cells of the xenograft, i.e. they inhibit antibody-mediated rejection, received by prolonging the survival of the pig xenograft in the

P-PSDB;
The invention relates to a therapeutic composition comprising polypeptide. The fusion protein comprises a polypeptide which specifically binds CD38 (e.g., an anti-CD38 antibody), linked polypeptide which specifically binds DNA (e.g., protamine). The polypeptide which specifically binds DNA (e.g., protamine).
                                                                                                                                                                                          e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    QΥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               also provides a DNA sequence encoding a cytotoxic agent which is coperably linked to a cell or tissue-specific transcriptional unit. The ctherapeutic compositions can be used to inhibit the growth of CD38+CC ells. They can be used to inhibit or treat multiple myeloma, primary can look be used for treating B cell lymphomas, B cell specific proliferative compositions (e.g., leukaemias) or hypersensitivity responses, systemic compositivity responses, systemic critematoid arthritis, and antibody or non-antibody mediated autoimmune confidences. The fusion proteins can also be used for detection and confidences. The fusion proteins can also be used for detection and confidences. The fusion proteins can also be used for detection and confidences. The fusion proteins can also be used for detection and confidences. The fusion proteins can also be used for detection and confidences. The fusion proteins can also be used for detection and confidence molecules but have reduced or no immunogenicity. The present surface molecules but have reduced or no immunogenicity. The present compositions represents DNA encoding an anti-CD38 antibody single chain confidence confidence isolated Ig (immunoglobulin) heavy and light chain genes from an anti-CD38 hybridoma confidence confidence in the solated Ig (immunoglobulin) heavy and light chain genes from an anti-CD38 hybridoma confidence confidence in the specification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The MAb can be used diagnose disorders associated with the pathological complexation of DNA, e.g. inflammatory glomerulonephritis and systemic lupus erythematosus. It can also be used to generate reagents to screen for pharmaceutical agents, and treat and/or prevent an above disorder.

The sequence was derived by aligning homologous anti-DNA MAb cDNA, whose sequences have been published, as well as several MAb of other specificities obtained from a database search.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Anti-DNA antibody which specifically binds DNA hairpin -develop prods. for diagnosis and treatment of disorders, glomerulonephritis or systemic lupus erythematosus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Glick

The antibody is used in cancer therapy. Association of the new antibody with an antigen is favoured over dissociation in vivo and they therefore have longer localisation times at target sites, resulting in a higher concentration of antibodies localised at the target sites. Targeting the antibody to a site in vivo is improved. The concentration of antibody does not need to be too high which reduces side-effects and costs of therapy. The present sequence represents the light chain variable region of a monoclonal antibody having affinity for carcinoembryonic antigen (CEA, a tumour associated antigen), which is used in the exemplification of the present invention

The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the
